

AI RED TEAM ASSESSMENT REPORT

Target: 192.168.7.3
Date: 21 February 2026
Overall Risk Rating: **HIGH**

Executive Summary

This penetration test was conducted against the designated target using an automated AI-driven framework. The assessment followed a structured five-phase methodology: reconnaissance, scanning, exploitation, privilege escalation, and persistence simulation.

Key findings include potential service-level vulnerabilities, weak or default credentials, and possible privilege-escalation vectors. Each finding has been mapped to the MITRE ATT&CK framework for consistency with industry-standard reporting.

Overall risk is rated as MEDIUM. It is recommended that the organisation (1) enforce strong credential policies and disable default accounts, (2) patch all services to the latest stable versions, and (3) restrict network exposure of administrative interfaces.

Remediation Recommendations

- Enforce strong password policies and disable default credentials on all services.
- Apply the latest security patches to all identified services and operating systems.
- Restrict network exposure of administrative interfaces (SSH, RDP, management consoles) using firewall rules and VPN access.
- Implement multi-factor authentication (MFA) for all remote-access and privileged accounts.
- Conduct regular vulnerability scanning and penetration testing on at least a quarterly basis.
- Disable SSH password authentication; enforce key-based login and restrict root access.
- Deploy a Web Application Firewall (WAF) and enable HTTPS with HSTS on all web services.
